

INDUZIONE STRUTTURALE

Definiamo BTree come

Definiamo $m : \text{BTree} \rightarrow \mathbb{N}$ conta i nodi di un albero binario

$$\begin{cases} m(\text{folia}) = 1 \\ m(\text{branch}(T_1, T_2)) = 1 + m(T_1) + m(T_2) \end{cases}$$

Definiamo $h : \text{BTree} \rightarrow \mathbb{N}$ calcola l'altezza dell'albero

$$\begin{cases} h(\text{folia}) = 0 \\ h(\text{branch}(T_1, T_2)) = 1 + \max(h(T_1), h(T_2)) \end{cases}$$

calcola il valore massimo tra due valori

Dimostrare per induzione ~~strutturale~~ strutturale che

⊛ $\forall T \in \text{BTree}. m(T) \leq 2^{h(T)+1} - 1$

Base: Dobbiamo dimostrare ⊛ per gli elementi folia

$$\begin{aligned} T = \text{folia} \quad m(T) &= m(\text{folia}) = 1 \\ h(T) &= h(\text{folia}) = 0 \end{aligned}$$

$$\text{Calcoliamo } 2^{h(T)+1} - 1 = 2^{0+1} - 1 = 1$$

$$m(T) = 2^{h(T)+1} - 1 \quad \checkmark$$

Peso induttivo : $T = \text{branch}(T_1, T_2)$

Supponiamo per Hp. ind. che

$$\text{Hp. ind.} \rightarrow \begin{cases} \textcircled{*} m(T_1) \leq 2^{h(T_1)+1} - 1 \\ \textcircled{*} m(T_2) \leq 2^{h(T_2)+1} - 1 \end{cases}$$

dimostriamo che $m(T) \leq 2^{h(T)+1} - 1$

$$m(T) = 1 + m(T_1) + m(T_2) \quad \boxed{h(T)} = \textcircled{1} + \max(h(T_1), h(T_2))$$

$$m(T) = 1 + m(T_1) + m(T_2) \leq 1 + 2^{h(T_1)+1} - 1 + 2^{h(T_2)+1} - 1$$

per def di m

per $\textcircled{*}$

$$\text{Hp. ind.} \rightarrow 2(2^h) = 2^{h+1}$$

$$\leq 2^h + 2^h - 1$$

$$= 2^{h+1} - 1$$

$$= 2^{h(T)+1} - 1$$

$$h \geq h(T_1) + 1$$

$$h \geq h(T_2) + 1$$

BTree, definiamo

$\ell : \text{BTree} \rightarrow \mathbb{N}$ conta le foglie

$$\ell(\text{foglia}) = 1$$

$$\ell(\text{branch}(T_1, T_2)) = \ell(T_1) + \ell(T_2)$$

Dimostrare che $\ell(T) \leq 2^{h(T)} \quad \forall T \in \text{BTree}$

Base: $T = \text{foglia}$: $e(T) = 1$ $1 \leq 2^0 = 1$ ✓
 $h(T) = 0$

Passo Induttivo $T = \text{branch} (T_1, T_2)$

Hp. ind.: $e(T_1) \leq 2^{h(T_1)}$ $e(T_2) \leq 2^{h(T_2)}$

Dobbiamo dimostrare che $e(T) \leq 2^{h(T)}$

$$e(T) = e(T_1) + e(T_2) \quad h(T) = 1 + \max(h(T_1), h(T_2))$$

$$e(T) = e(T_1) + e(T_2) \leq 2^{h(T_1)} + 2^{h(T_2)}$$

Hp. ind.

per def di e

$$h = \max(h(T_1), h(T_2))$$

$\Rightarrow$

$$h(T_1) \leq h$$

$$h(T_2) \leq h$$

$$\leq 2^h + 2^h = 2(2^h) = 2^{h+1} = 2^{h(T)}$$

Exp (espressioni) definite induttivamente
 aritmetiche

$\begin{cases} m \in \text{Exp} \\ e_1, e_2 \in \text{Exp} \end{cases}$ def. di Exp
 $e_1 + e_2 \in \text{Exp} \quad e_1 - e_2 \in \text{Exp}$

Def. val: $\text{Exp} \rightarrow \mathbb{N}$ numero di numeri m presenti in una exp

$$\begin{cases} \text{val}(m) = 1 \\ \text{val}(e_1 + e_2) = \text{val}(e_1 - e_2) = \text{val}(e_1) + \text{val}(e_2) \end{cases}$$

Def op: $\text{Exp} \rightarrow \mathbb{N}$ numero di operatori in exp $(+, -)$

$$\begin{cases} \text{op}(m) = 0 \\ \text{op}(e_1 + e_2) = \text{op}(e_1 - e_2) = \text{op}(e_1) + \text{op}(e_2) + 1 \end{cases}$$

Dimostrare che $\text{val}(e) = \text{op}(e) + 1 \quad \forall e \in \text{Exp}$

Base: $e = m \quad \text{val}(e) = \text{val}(m) = 1$
 $\text{op}(e) = \text{op}(m) = 0 \quad 1 = 0 + 1 \quad \checkmark$

Passo ind: $e_1 + e_2$ ($e_1 - e_2$ analogo)
 perché la definizione di
 op e val non dipende
 dal tipo di operatore

Hp. ind $\text{val}(e_1) = \text{op}(e_1) + 1$
 $\text{val}(e_2) = \text{op}(e_2) + 1$

Dobbiamo dim. che $\text{val}(e) = \text{op}(e) + 1$

$$\begin{aligned} \text{val}(e) &= \text{val}(e_1) + \text{val}(e_2) = \text{op}(e_1) + 1 + \text{op}(e_2) + 1 \\ &\quad \uparrow \text{ per def di val} \quad \text{Hp. ind.} \\ &= \boxed{\text{op}(e_1) + \text{op}(e_2) + 1} + 1 = \text{op}(e) + 1 \\ &\quad \text{op}(e) \\ &\quad \text{per def di op} \end{aligned}$$

```

{ int z=1;
  int y=2;
  void A() { int z = x + y; }
  void B() { int x=2;
             int w=4;
             void C() { int x = y + w;
                        A();
                        y = z + y;

```

main
